Teacher’s Guide to Using the
Chapter 8 Resource Masters

The Chapter 8 Resource Masters includes the core materials needed for Chapter 8. These materials include worksheets, extensions, and assessment options. The answers for these pages appear at the back of this booklet.

All of the materials found in this booklet are included for viewing, printing, and editing at connectED.mcgraw-hill.com.

Chapter Resources

Student-Built Glossary (pages 1–2) These masters are a student study tool that presents up to twenty of the key vocabulary terms from the chapter. Students are to record definitions and/or examples for each term. You may suggest that students highlight or star the terms with which they are not familiar. Give this to students before beginning Lesson 8-1. Encourage them to add these pages to their mathematics study notebooks. Remind them to complete the appropriate words as they study each lesson.

Anticipation Guide (pages 3–4) This master, presented in both English and Spanish, is a survey used before beginning the chapter to pinpoint what students may or may not know about the concepts in the chapter. Students will revisit this survey after they complete the chapter to see if their perceptions have changed.

Lesson Resources

Study Guide and Intervention These masters provide vocabulary, key concepts, additional worked-out examples and Check Your Progress exercises to use as a reteaching activity. It can also be used in conjunction with the Student Edition as an instructional tool for students who have been absent.

Skills Practice This master focuses more on the computational nature of the lesson. Use as an additional practice option or as homework for second-day teaching of the lesson.

Practice This master closely follows the types of problems found in the Exercises section of the Student Edition and includes word problems. Use as an additional practice option or as homework for second-day teaching of the lesson.

Word Problem Practice This master includes additional practice in solving word problems that apply the concepts of the lesson. Use as an additional practice or as homework for second-day teaching of the lesson.

Enrichment These activities may extend the concepts of the lesson, offer an historical or multicultural look at the concepts, or widen students’ perspectives on the mathematics they are learning. They are written for use with all levels of students.

Graphing Calculator, TI-Nspire or Spreadsheet Activities These activities present ways in which technology can be used with the concepts in some lessons of this chapter. Use as an alternative approach to some concepts or as an integral part of your lesson presentation.
Assessment Options

The assessment masters in the Chapter 8 Resource Masters offer a wide range of assessment tools for formative (monitoring) assessment and summative (final) assessment.

Student Recording Sheet This master corresponds with the standardized test practice at the end of the chapter.

Extended Response This master provides information for teachers and students on how to assess performance on open-ended questions.

Quizzes Four free-response quizzes offer assessment at appropriate intervals in the chapter.

Mid-Chapter Test This 1-page test provides an option to assess the first half of the chapter. It parallels the timing of the Mid-Chapter Quiz in the Student Edition and includes both multiple-choice and free-response questions.

Vocabulary Test This test is suitable for all students. It includes a list of vocabulary words and 9 questions to assess students’ knowledge of those words. This can also be used in conjunction with one of the leveled chapter tests.

Leveled Chapter Tests

• Form 1 contains multiple-choice questions and is intended for use with below grade level students.
• Forms 2A and 2B contain multiple-choice questions aimed at on grade level students. These tests are similar in format to offer comparable testing situations.
• Forms 2C and 2D contain free-response questions aimed at on grade level students. These tests are similar in format to offer comparable testing situations.
• Form 3 is a free-response test for use with above grade level students.

All of the above mentioned tests include a free-response Bonus question.

Extended-Response Test Performance assessment tasks are suitable for all students. Sample answers and a scoring rubric are included for evaluation.

Standardized Test Practice These three pages are cumulative in nature. It includes three parts: multiple-choice questions with bubble-in answer format, griddable questions with answer grids, and short-answer free-response questions.

Answers
• The answers for the Anticipation Guide and Lesson Resources are provided as reduced pages.
• Full-size answer keys are provided for the assessment masters.
This is an alphabetical list of the key vocabulary terms you will learn in Chapter 8. As you study the chapter, complete each term’s definition or description. Remember to add the page number where you found the term. Add these pages to your Algebra Study Notebook to review vocabulary at the end of the chapter.

**Polynomials in Standard Form** A polynomial is a monomial or a sum of monomials. A binomial is the sum of two monomials, and a trinomial is the sum of three monomials. Polynomials with more than three terms have no special name. The degree of a monomial is the sum of the exponents of all its variables. The degree of the polynomial is the same as the degree of the monomial term with the highest degree.

The terms of a polynomial are usually arranged so that the terms are in order from greatest degree to least degree. This is called the **standard form of a polynomial**.

### Example
Determine whether each expression is a polynomial. If so, identify the polynomial as a monomial, binomial, or trinomial. Then find the degree of the polynomial.

8-1 Study Guide and Intervention (continued)

Adding and Subtracting Polynomials

Add and Subtract Polynomials To add polynomials, you can group like terms horizontally or write them in column form, aligning like terms vertically. Like terms are monomial terms that are either identical or differ only in their coefficients, such as 3p and \(-5p\) or \(2x^2y\) and \(8x^2y\).

You can subtract a polynomial by adding its additive inverse. To find the additive inverse of a polynomial, replace each term with by adding its additive inverse. To find the additive inverse of a polynomial, replace each term with its additive inverse or opposite.

**Example** Find \((3x^2 + 2x - 6) - (2x + x^2 + 3)\).

**Horizontal Method**

Use additive inverses to rewrite as addition. Then group like terms.

\[
(3x^2 + 2x - 6) - (2x + x^2 + 3) = (3x^2 + 2x - 6) + \left[(-2x) + (-x^2) + (-3)\right]
= [3x^2 + (-x^2)] + [2x + (-2x)] + [-6 + (-3)]
= 2x^2 + (-9)
= 2x^2 - 9
\]

The difference is \(2x^2 - 9\).

**Vertical Method**

Align like terms in columns and subtract by adding the additive inverse.

\[
\begin{align*}
3x^2 & \quad + \quad 2x & \quad - \quad 6 \\
(-) & \quad x^2 & \quad + \quad 2x & \quad + \quad 3 \\
3x^2 & \quad + \quad 2x & \quad - \quad 6 \\
(+) & \quad -x^2 & \quad - \quad 2x & \quad - \quad 3 \\
2x^2 & \quad - \quad 9
\end{align*}
\]

The difference is \(2x^2 - 9\).

Second Degree Polynomial Functions

Many real world problems can be modeled using polynomial functions. The Table function can be used to evaluate a function for multiple values.

Example

An object is dropped from the top of a 179-foot cliff to the water below. The height of the object above the water can be modeled by \( h(t) = -16t^2 + 179 \) where \( t \) is time in seconds.

a. Determine the height of the object after 0.5 second, 1 second, 1.5 seconds, and 2 seconds.

Enter the function into \( Y_1 \). Use \( \text{2nd} \ [ \text{TBLSET} ] \) to set up the calculator to display values of \( t \) in 0.5 second intervals. Display the table and record the results.

Examine the table. When \( x = 0.5 \), \( y = 175 \). This means that \( h(0.5) = 175 \), or that after 0.5 second, the object is 175 feet above the water. Thus, \( h(1) = 163 \) feet, \( h(1.5) = 143 \) feet, and \( h(2) = 115 \) feet.

b. After how many seconds does the object hit the water? Round to the nearest hundredth.

Scroll through the table. Notice that the \( y \)-values change from positive to negative between \( x = 3 \) and \( x = 3.5 \). Examine this interval more closely by resetting the table using \( \text{TbllStart} = 3 \) and \( \Delta \text{Tbl} = 0.1 \). Look for the change in sign.

Further examine the interval from \( x = 3.3 \) to \( x = 3.4 \) using \( \text{TbllStart} = 3.3 \) and \( \Delta \text{Tbl} = 0.01 \).

The \( y \)-value closest to zero occurs when \( x = 3.34 \). Thus, the object hits the water after about 3.34 seconds.

Exercises

1. An object is dropped from the top of a building that is 412 feet high. The distance, in feet, above the ground at \( x \) seconds is given by \( P(x) = -16x^2 + 412 \).

a. After how many seconds will the object be 100 feet above the ground?

b. How many seconds will it take the object to reach the ground?

2. A bungee jumper free falls from the Royal Gorge suspension bridge over the Arkansas River, 1053 feet above the river. The height \( h \) of the bungee jumper above the river, in feet, after \( t \) seconds can be represented by \( h = -16t^2 + 1053 \). Two seconds after the first bungee jumper falls, another person jumps down with an initial velocity of 80 feet per second. The position of the second jumper can be represented by the equation \( h = -16(t - 2)^2 - 80(t - 2) + 1053 \).

a. If the bungee cords are designed to stretch just enough so that the jumpers touch the water before springing back up, which jumper will touch the water first? How long does it take each jumper to touch the water?

b. Does the second jumper catch up to the first jumper? If so, how far are they above the river at this point and how long does it take each jumper to reach this point?

Multiplying a Polynomial by a Monomial

Polynomial Multiplied by Monomial The Distributive Property can be used to multiply a polynomial by a monomial. You can multiply horizontally or vertically. Sometimes multiplying results in like terms. The products can be simplified by combining like terms.

Example 1 Find \(-3x^2(4x^2 + 6x - 8)\).

Horizontal Method
\(-3x^2(4x^2 + 6x - 8) = -3x^2(4x^2) + (-3x^2)(6x) - (-3x^2)(8) = -12x^4 - 18x^3 + 24x^2\)

Vertical Method
\[
\begin{array}{ccc}
4x^2 + 6x - 8 & \times & -3x^2 \\
\hline
12x^4 & -18x^3 & +24x^2
\end{array}
\]

The product is \(-12x^4 - 18x^3 + 24x^2\).

Example 2 Simplify \(-2(4x^2 + 5x) - x(x^2 + 6x)\).

\[
-2(4x^2 + 5x) - x(x^2 + 6x) = -2(4x^2) + (-2)(5x) + (-x)(x^2) + (-x)(6x) = -8x^2 + (-10x) + (-x^3) + (-6x^2) = (-x^3) + [-8x^2 + (-6x^2)] + (-10x) = -x^3 - 14x^2 - 10x
\]

Multiplying Polynomials

Multiply Binomials To multiply two binomials, you can apply the Distributive Property twice. A useful way to keep track of terms in the product is to use the FOIL method as illustrated in Example 2.

Example 1 Find \((x + 3)(x - 4)\).

**Horizontal Method**

\((x + 3)(x - 4)\)

\[= x(x - 4) + 3(x - 4)\]

\[= x^2 - 4x + 3x - 12\]

\[= x^2 - x - 12\]

**Vertical Method**

\[\begin{array}{c}
  x \\
  + 3 \\
  \hline \\
  x \\
  - 4 \\
  \hline \\
  -4x - 12 \\
  \hline \\
  x^2 + 3x \\
  \hline \\
  x^2 - x - 12
\end{array}\]

The product is \(x^2 - x - 12\).

Example 2 Find \((x - 2)(x + 5)\) using the FOIL method.

\((x - 2)(x + 5)\)

\[= (x)(x) + (x)(5) + (-2)(x) + (-2)(5)\]

\[= x^2 + 5x - 2x - 10\]

\[= x^2 + 3x - 10\]

The product is \(x^2 + 3x - 10\).

8-3 Spreadsheet Activity

Multiplying Polynomials

Example

A box is made by cutting a square with sides \( x \) inches long from each corner of a piece of cardboard and folding up the sides. If the piece of cardboard is 15 inches long and 12 inches wide, what integer value of \( x \) allows you to make the box with the greatest volume? What is the volume?

Step 1  The finished box will be \( x \) inches high, \( 12 - 2x \) inches wide, and \( 15 - 2x \) inches long. The volume of the box is \( x(12 - 2x)(15 - 2x) \) cubic inches.

Step 2  Use Column A of the spreadsheet for the value of \( x \). Enter the formulas for the width, length, and volume in Columns B, C, and D.

<table>
<thead>
<tr>

<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
</tr>
</thead>
<tbody>

</tr>
<tr>

</tr>

<td>7</td>
<td>112</td>
</tr>
<tr>
<td>6</td>
<td>5</td>
<td>2</td>
<td>5</td>
<td>50</td>
</tr>
</tbody>
</table>

Notice that \( x \) cannot be greater than 5 because \( 12 - 2x \) must be positive. In this case, the box with the greatest volume is 176 cubic inches when \( x = 2 \).

Exercises

Use the spreadsheet to find the value of \( x \) that allows the box with the greatest volume for each piece of cardboard. State the volume of the box.

1. 16 inches long and 10 inches wide  
2. 24 inches long and 18 inches wide

3. 28 inches long and 16 inches wide  
4. 36 inches long and 24 inches wide

5. 48 inches long and 48 inches wide  
6. 108 inches long and 44 inches wide

7. Study the spreadsheet you created for Exercise 5. Suppose \( y \) is the volume of the box with a height of \( x \) inches. If you were to graph the ordered pairs \((x, y)\) and connect them with a smooth curve, what would you expect the graph to look like? Use the graphing tool in the spreadsheet to verify your conjecture.
Special Products

Squares of Sums and Differences

Some pairs of binomials have products that follow specific patterns. One such pattern is called the square of a sum. Another is called the square of a difference.

<table>
<thead>
<tr>
<th>Square of a Sum</th>
<th>$(a + b)^2 = (a + b)(a + b) = a^2 + 2ab + b^2$</th>
</tr>
</thead>
<tbody>
<tr>
<td>Square of a Difference</td>
<td>$(a - b)^2 = (a - b)(a - b) = a^2 - 2ab + b^2$</td>
</tr>
</tbody>
</table>

**Example 1**

Find $(3a + 4)(3a + 4)$.

Use the square of a sum pattern, with $a = 3a$ and $b = 4$.

$$(3a + 4)(3a + 4) = (3a)^2 + 2(3a)(4) + (4)^2$$

$= 9a^2 + 24a + 16$

The product is $9a^2 + 24a + 16$.

**Example 2**

Find $(2z - 9)(2z - 9)$.

Use the square of a difference pattern with $a = 2z$ and $b = 9$.

$$(2z - 9)(2z - 9) = (2z)^2 - 2(2z)(9) + (9)(9)$$

$= 4z^2 - 36z + 81$

The product is $4z^2 - 36z + 81$.

Special Products

Product of a Sum and a Difference There is also a pattern for the product of a sum and a difference of the same two terms, \((a + b)(a - b)\). The product is called the difference of squares.

| Product of a Sum and a Difference | \((a + b)(a - b) = a^2 - b^2\) |

Example Find \((5x + 3y)(5x - 3y)\).

\[
(a + b)(a - b) = a^2 - b^2
\]

\[
(5x + 3y)(5x - 3y) = (5x)^2 - (3y)^2

Using the Distributive Property

Use the Distributive Property to Factor The Distributive Property has been used to multiply a polynomial by a monomial. It can also be used to express a polynomial in factored form. Compare the two columns in the table below.

<table>
<thead>

<tr>

<td>(= 12xy + 6y)</td>
</tr>
<tr>

<td>(= 6y(2x + 1))</td>

</tbody>

Example 1 Use the Distributive Property to factor \(12mp + 80m^2\).

Find the GCF of \(12mp\) and \(80m^2\).

\(12mp = 2 \cdot 2 \cdot 3 \cdot m \cdot p\)

\(80m^2 = 2 \cdot 2 \cdot 2 \cdot 2 \cdot 5 \cdot m \cdot m\)

GCF = \(2 \cdot 2 \cdot m\) or \(4m\)

Write each term as the product of the GCF and its remaining factors.

\(12mp + 80m^2 = 4m(3 \cdot p) + 4m(2 \cdot 2 \cdot 5 \cdot m)\)

\(= 4m(3p) + 4m(20m)\)

\(= 4m(3p + 20m)\)

Thus \(12mp + 80m^2 = 4m(3p + 20m)\).

Example 2 Factor \(6ax + 3ay + 2bx + by\) by grouping.

\(6ax + 3ay + 2bx + by\)

\(= (6ax + 3ay) + (2bx + by)\)

\(= 3a(2x + y) + b(2x + y)\)

\(= (3a + b)(2x + y)\)

Check using the FOIL method.

\((3a + b)(2x + y)\)

\(= 3a(2x) + (3a)(y) + (b)(2x) + (b)(y)\)

\(= 6ax + 3ay + 2bx + by\) ✓

Solve Equations by Factoring

The following property, along with factoring, can be used to solve certain equations.

**Zero Product Property**

For any real numbers \(a\) and \(b\), if \(ab = 0\), then either \(a = 0\), \(b = 0\), or both \(a\) and \(b\) equal 0.

**Example**

Solve \(9x^2 + x = 0\). Then check the solutions.

Write the equation so that it is of the form \(ab = 0\).

\[
9x^2 + x = 0 \quad \text{Original equation}
\]

\[
x(9x + 1) = 0 \quad \text{Factor the GCF of} \ 9x^2 + x, \ \text{which is} \ x.
\]

\[
x = 0 \ \text{or} \ 9x + 1 = 0 \quad \text{Zero Product Property}
\]

\[
x = 0 \quad x = -\frac{1}{9} \quad \text{Solve each equation.}
\]

The solution set is \(\{0, -\frac{1}{9}\}\).

**Check**

Substitute 0 and \(-\frac{1}{9}\) for \(x\) in the original equation.

\[
9x^2 + x = 0 \quad \text{Original equation}
\]

\[
9(0)^2 + 0 = 0 \quad 9\left(-\frac{1}{9}\right)^2 + \left(-\frac{1}{9}\right) = 0
\]

\[
0 = 0 \quad \frac{1}{9} + \left(-\frac{1}{9}\right) = 0
\]

\[
0 = 0 \quad 0 = 0

4. VERTICAL JUMP Your vertical jump height is measured by subtracting your standing reach height from the height of the highest point you can reach by jumping without taking a running start. Typically, NBA players have vertical jump heights of up to 34 inches. If an NBA player jumps this high, his height \( h \) in inches above his standing reach height after \( t \) seconds can be modeled by \( h = 162t - 192t^2 \). Solve the equation for \( h = 0 \) and interpret the solution. Round your answer to the nearest hundredth.

5. PETS Conner tosses a dog treat upward with an initial velocity of 13.7 meters per second. The height of the treat above the dog’s mouth \( h \) in meters after \( t \) seconds is given by \( h = 13.7t - 4.9t^2 \).
   
   a. Assuming the dog doesn’t jump, after how many seconds does the dog catch the treat?

   b. The dog treat reaches its maximum height halfway between when it was thrown and when it was caught. What is its maximum height?

   c. How fast would Connor have to throw the dog treat in order to make it fly through the air for 6 seconds?

Linear Combinations
The greatest common factor, GCF, of two numbers can be written as a linear combination of the two numbers. A linear combination is an expression of the form $Ax + By$.

Example
Write the greatest common factor of 52 and 36 as a linear combination.

First, use the Euclidean Algorithm to find the greatest common factor of the two numbers.

\[
\begin{array}{c|c}
36 & 52 \\
\hline
36 & 2 \\
16 & 36 \\
\hline
2 & 32 \\
4 & 16 \\
\hline
4 & 0 \\
\end{array}
\]

Divide the greater number by the lesser number.

Then divide using the remainder as the new divisor.

Second divisor; Divide again.

Stop dividing.

Last divisor used is the GCF. In this case, 4 is the GCF for 36 and 52.

To write 4 as a linear combination of 36 and 52, it needs to be written as:

\[4 = 36x + 52y, \text{ where } x \text{ and } y \text{ are some integers.}\]

Use trial and error to determine the two integers.

The two integers that work are $x = 3$ and $y = -2$. So, the linear combination for the greatest common factor of 52 and 36 is:

\[4 = 36(3) + 52(-2)\]

Solving \( x^2 + bx + c = 0 \)

Factor \( x^2 + bx + c \) To factor a trinomial of the form \( x^2 + bx + c \), find two integers, \( m \) and \( p \), whose sum is equal to \( b \) and whose product is equal to \( c \).

<table>
<thead>
<tr>
<th>Factors of 10</th>
<th>Sum of Factors</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 10</td>
<td>11</td>
</tr>
<tr>
<td>2, 5</td>
<td>7</td>
</tr>
</tbody>
</table>

In this trinomial, \( b = 7 \) and \( c = 10 \).

Example 1  Factor each polynomial.

a. \( x^2 + 7x + 10 \)

In this trinomial, \( b = 7 \) and \( c = 10 \).

Since \( 2 + 5 = 7 \) and \( 2 \cdot 5 = 10 \), let \( m = 2 \) and \( p = 5 \).

\( x^2 + 7x + 10 = (x + 5)(x + 2) \)

b. \( x^2 - 8x + 7 \)

In this trinomial, \( b = -8 \) and \( c = 7 \).

Notice that \( m + p \) is negative and \( mp \) is positive, so \( m \) and \( p \) are both negative.

Since \( -7 + (-1) = -8 \) and \( -7)(-1) = 7 \), \( m = -7 \) and \( p = -1 \).

\( x^2 - 8x + 7 = (x - 7)(x - 1) \)

Example 2  Factor \( x^2 + 6x - 16 \).

In this trinomial, \( b = 6 \) and \( c = -16 \). This means \( m + p \) is positive and \( mp \) is negative. Make a list of the factors of \( -16 \), where one factor of each pair is positive.

<table>
<thead>
<tr>
<th>Factors of (-16)</th>
<th>Sum of Factors</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, -16</td>
<td>-15</td>
</tr>
<tr>
<td>-1, 16</td>
<td>15</td>
</tr>
<tr>
<td>2, -8</td>
<td>-6</td>
</tr>
<tr>
<td>-2, 8</td>
<td>6</td>
</tr>
</tbody>
</table>

Therefore, \( m = -2 \) and \( p = 8 \).

\( x^2 + 6x - 16 = (x - 2)(x + 8) \)

**Solve Equations by Factoring** Factoring and the Zero Product Property can be used to solve many equations of the form \( x^2 + bx + c = 0 \).

### Example 1

Solve \( x^2 + 6x = 7 \). Check your solutions.

\[
\begin{align*}
&x^2 + 6x = 7 & \text{Original equation} \\
&x^2 + 6x - 7 = 0 & \text{Rewrite equation so that one side equals 0.} \\
&(x - 1)(x + 7) = 0 & \text{Factor.} \\
&x - 1 = 0 \text{ or } x + 7 = 0 & \text{Zero Product Property} \\
&x = 1 \quad x = -7 & \text{Solve each equation.}
\end{align*}
\]

The solution set is \( \{1, -7\} \). Since \( 1^2 + 6(1) = 7 \) and \( (-7)^2 + 6(-7) = 7 \), the solutions check.

### Example 2

If a rocket is fired with initial velocity 2288 feet per second, how many seconds will it take for the rocket to reach a height of 6720 feet?

\[
\begin{align*}
h &= vt - 16t^2 & \text{Formula} \\
6720 &= 2288t - 16t^2 & \text{Substitute.} \\
0 &= -16t^2 + 2288t - 6720 & \text{Rewrite equation so that one side equals 0.} \\
0 &= -16(t - 143t + 420) & \text{Factor out GCF.} \\
0 &= -16(t - 3)(t - 140) & \text{Factor} \\
t - 3 = 0 \text{ or } t - 140 = 0 & \text{Zero Product Property} \\
t = 3 \quad t = 140 & \text{Solve each equation.}
\end{align*}
\]

The rocket reaches 6720 feet in 3 seconds and again in 140 seconds, or 2 minutes 20 seconds after launch.

Prime numbers have interested mathematicians for centuries. They have tried to find expressions that will give all the prime numbers, or only prime numbers. In the 1700s, Euler discovered that the trinomial \( x^2 + x + 41 \) will yield prime numbers for values of \( x \) from 0 through 39.

Solving \( ax^2 + bx + c = 0 \)

**Factor \( ax^2 + bx + c \)** To factor a trinomial of the form \( ax^2 + bx + c \), find two integers, \( m \) and \( p \) whose product is equal to \( ac \) and whose sum is equal to \( b \). If there are no integers that satisfy these requirements, the polynomial is called a **prime polynomial**.

**Example 1**  
Factor \( 2x^2 + 15x + 18 \).

In this example, \( a = 2 \), \( b = 15 \), and \( c = 18 \). You need to find two numbers that have a sum of 15 and a product of \( 2 \cdot 18 = 36 \). Make a list of the factors of 36 and look for the pair of factors with a sum of 15.

<table>
<thead>
<tr>
<th>Factors of 36</th>
<th>Sum of Factors</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 36</td>
<td>37</td>
</tr>
<tr>
<td>2, 18</td>
<td>20</td>
</tr>
<tr>
<td>3, 12</td>
<td>15</td>
</tr>
</tbody>
</table>

Use the pattern \( ax^2 + mx + px + c \), with \( a = 2 \), \( m = 3 \), \( p = 12 \), and \( c = 18 \).

\[
2x^2 + 15x + 18 = 2x^2 + 3x + 12x + 18 \\
= (2x^2 + 3x) + (12x + 18) \\
= x(2x + 3) + 6(2x + 3) \\
= (x + 6)(2x + 3)
\]

Therefore, \( 2x^2 + 15x + 18 = (x + 6)(2x + 3) \).

**Example 2**  
Factor \( 3x^2 - 3x - 18 \).

Note that the GCF of the terms \( 3x^2 \), \( 3x \), and \( 18 \) is 3. First factor out this GCF.

\[
3x^2 - 3x - 18 = 3(x^2 - x - 6).
\]

Now factor \( x^2 - x - 6 \). Since \( a = 1 \), find the two factors of \(-6\) with a sum of \(-1\).

<table>
<thead>
<tr>
<th>Factors of (-6)</th>
<th>Sum of Factors</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, -6</td>
<td>-5</td>
</tr>
<tr>
<td>-1, 6</td>
<td>5</td>
</tr>
<tr>
<td>-2, 3</td>
<td>1</td>
</tr>
<tr>
<td>2, -3</td>
<td>-1</td>
</tr>
</tbody>
</table>

Now use the pattern \((x + m)(x + p)\) with \( m = 2 \) and \( p = -3 \).

\[
x^2 - x - 6 = (x + 2)(x - 3)
\]

The complete factorization is \( 3x^2 - 3x - 18 = 3(x + 2)(x - 3) \).

**Exercises**

Area Models for Quadratic Trinomials

After you have factored a quadratic trinomial, you can use the factors to draw geometric models of the trinomial.

\[ x^2 + 5x - 6 = (x - 1)(x + 6) \]

To draw a rectangular model, the value 2 was used for \( x \) so that the shorter side would have a length of 1. Then the drawing was done in centimeters. So, the area of the rectangle is \( x^2 + 5x - 6 \).

To draw a right triangle model, recall that the area of a triangle is one-half the base times the height. So, one of the sides must be twice as long as the shorter side of the rectangular model.

\[ x^2 + 5x - 6 = (x - 1)(x + 6) \]
\[ = \frac{1}{2} (2x - 2)(x + 6) \]

The area of the right triangle is also \( x^2 + 5x - 6 \).

**Factor each trinomial. Then follow the directions to draw each model of the trinomial.**

1. \( x^2 + 2x - 3 \) Use \( x = 2 \). Draw a rectangle in centimeters.

2. \( 3x^2 + 5x - 2 \) Use \( x = 1 \). Draw a rectangle in centimeters.

3. \( x^2 - 4x + 3 \) Use \( x = 4 \). Draw two different right triangles in centimeters.

4. \( 9x^2 - 9x + 2 \) Use \( x = 2 \). Draw two different right triangles.

   Use 0.5 centimeter for each unit.
Graphing Calculator Activity

Using Tables in Factoring by Grouping

The TABLE feature can be used to help factor a polynomial by finding the factors of a certain product, which have a specific sum.

Example 1  Factor $10x^2 - 43x + 28$ by grouping.

Make a table of the negative factors of $10 \cdot 28$ or 280. Look for a pair of factors whose sum is $-43$.

Enter the equation $y = \frac{280}{x}$ in Y1 to find the factors of 280. Then, find the sum of the factors using $y = \frac{280}{x} + x$ in Y2. Set up the table to display the negative factors of 280 by setting $\Delta Tbl = -1$.

Examine the results.

The last line of the table shows that $-43x$ may be replaced with $-8x + (-35x)$.

$10x^2 - 43x + 28 = 10x^2 - 8x + (-35x) + 28$

$= 2x(5x - 4) + (-7)(5x - 4)$

$= (5x - 4)(2x - 7)$

Thus, $10x^2 - 43x + 28 = (5x - 4)(2x - 7)$.

Example 2  Factor $12x^2 - 7x - 12$.

Look at the factors of $12 \cdot -12$ or $-144$ for a pair whose sum is $-7$. Enter an equation to determine the factors in Y1 and an equation to find the sum of factors in Y2. Examine the table to find a sum of $-7$.

$12x^2 - 7x - 12 = 12x^2 + 9x + (-16x) - 12$

$= 3x(4x + 3) - 4(4x + 3)$

$= (4x + 3)(3x - 4)$

Thus, $12x^2 - 7x - 12 = (4x + 3)(3x - 4)$.

Differences of Squares

Solve Equations by Factoring  Factoring and the Zero Product Property can be used to solve equations that can be written as the product of any number of factors set equal to 0.

Example  Solve each equation. Check your solutions.

a. \(x^2 - \frac{1}{25} = 0\)

\[
x^2 - \frac{1}{25} = 0 \quad \text{Original equation}
x^2 - \left(\frac{1}{5}\right)^2 = 0 \quad x^2 = x \cdot x \text{ and } \frac{1}{25} = \left(\frac{1}{5}\right)\left(\frac{1}{5}\right)
\]

\[
\left(x + \frac{1}{5}\right)(x - \frac{1}{5}) = 0 \quad \text{Factor the difference of squares.}
x + \frac{1}{5} = 0 \quad \text{or} \quad x - \frac{1}{5} = 0 \quad \text{Zero Product Property}
x = -\frac{1}{5} \quad \text{or} \quad x = \frac{1}{5} \quad \text{Solve each equation.}
\]

The solution set is \(\left\{-\frac{1}{5}, \frac{1}{5}\right\}\). Since \(-\frac{1}{5}\) \(-\frac{1}{25} = 0\) and \(\frac{1}{5}\) \(\frac{1}{25} = 0\), the solutions check.

b. \(4x^3 = 9x\)

\[
4x^3 = 9x \quad \text{Original equation}
\]

\[
4x^3 - 9x = 0 \quad \text{Subtract } 9x \text{ from each side.}
x(4x^2 - 9) = 0 \quad \text{Factor out the GCF of } x.
x[(2x)^2 - 3^2] = 0 \quad 4x^2 = 2x \cdot 2x \text{ and } 9 = 3 \cdot 3
\]

\[
x[(2x)^2 - 3^2] = x[(2x - 3)(2x + 3)] \quad \text{Factor the difference of squares.}
x = 0 \quad \text{or} \quad (2x - 3) = 0 \quad \text{or} \quad (2x + 3) = 0 \quad \text{Zero Product Property}
x = 0 \quad \text{or} \quad x = \frac{3}{2} \quad \text{Solve each equation.}
\]

The solution set is \(\left\{0, \frac{3}{2} \right\}\).

Since \(4(0)^3 = 9(0)\), \(4\left(\frac{3}{2}\right)^3 = 9\left(\frac{3}{2}\right)\), and \(4\left(-\frac{3}{2}\right)^3 = 9\left(-\frac{3}{2}\right)\), the solutions check.

Factoring Trinomials of Fourth Degree

Some trinomials of the form $a^4 + a^2b^2 + b^4$ can be written as the difference of two squares and then factored.

**Example** Factor $4x^4 - 37x^2y^2 + 9y^4$.

**Step 1** Find the square roots of the first and last terms.

\[
\sqrt{4x^4} = 2x^2 \quad \sqrt{9y^4} = 3y^2
\]

**Step 2** Find twice the product of the square roots.

\[2(2x^2)(3y^2) = 12x^2y^2\]

**Step 3** Separate the middle term into two parts. One part is either your answer to Step 2 or its opposite. The other part should be the opposite of a perfect square.

\[-37x^2y^2 = -12x^2y^2 - 25x^2y^2\]

**Step 4** Rewrite the trinomial as the difference of two squares and then factor.

\[4x^4 - 37x^2y^2 + 9y^4 = (4x^4 - 12x^2y^2 + 9y^4) - 25x^2y^2\]
\[= (2x^2 - 3y^2)^2 - 25x^2y^2\]
\[= [(2x^2 - 3y^2) + 5xy] [(2x^2 - 3y^2) - 5xy]\]

7. $4x^4 - 21x^2y^2 + 9y^4$
8. $4a^4 - 29a^2b^2 + 25b^4$
There is a special pattern you can use to factor binomials of the form $a^2 - b^2$. You can use a spreadsheet to discover this relationship.

**Example**

Use a spreadsheet to investigate the values of the expressions $(a^2 - b^2)$, $(a - b)^2$, $(a - b)(a + b)$, and $(a + b)^2$. What conjecture can you make about the expressions?

**Step 1** You will use Columns A and B to enter various values that you choose for $a$ and $b$.

**Step 2** Enter the formulas for $(a^2 - b^2)$, $(a - b)^2$, $(a - b)(a + b)$, and $(a + b)^2$ in Columns C, D, E, and F. To enter an exponent, use the symbol ^ followed by the exponent. For example, the square of the value in cell A2 is entered as $A2^2$.

**Exercises**

**Example 1**

Determine whether $16n^2 - 24n + 9$ is a perfect square trinomial. If so, factor it.

Since $16n^2 = (4n)(4n)$, the first term is a perfect square.

Since $9 = 3 \cdot 3$, the last term is a perfect square.

The middle term is equal to $2(4n)(3)$.

Therefore, $16n^2 - 24n + 9$ is a perfect square trinomial.

$16n^2 - 24n + 9 = (4n)^2 - 2(4n)(3) + 3^2 = (4n - 3)^2$

Perfect Squares

Solve Equations with Perfect Squares  Factoring and the Zero Product Property can be used to solve equations that involve repeated factors. The repeated factor gives just one solution to the equation. You may also be able to use the Square Root Property below to solve certain equations.

| Square Root Property | For any number \( n > 0 \), if \( x^2 = n \), then \( x = \pm \sqrt{n} \). |

Example

Solve each equation. Check your solutions.

a. \( x^2 - 6x + 9 = 0 \)

\[
\begin{align*}
  x^2 - 6x + 9 &= 0 & \text{Original equation} \\
  x^2 - 2(3x) + 3^2 &= 0 & \text{Recognize a perfect square trinomial.} \\
  (x - 3)(x - 3) &= 0 & \text{Factor the perfect square trinomial.} \\
  x - 3 &= 0 & \text{Set repeated factor equal to 0.} \\
  x &= 3 & \text{Solve.}
\end{align*}
\]

The solution set is \( \{3\} \). Since \( 3^2 - 6(3) + 9 = 0 \), the solution checks.

b. \( (a - 5)^2 = 64 \)

\[
\begin{align*}
  (a - 5)^2 &= 64 & \text{Original equation} \\
  a - 5 &= \pm \sqrt{64} & \text{Square Root Property} \\
  a - 5 &= \pm 8 & 64 = 8 \cdot 8 \\
  a &= 5 \pm 8 & \text{Add 5 to each side.} \\
  a &= 5 + 8 \quad \text{or} \quad a &= 5 - 8 & \text{Separate into 2 equations.} \\
  a &= 13 \quad \text{or} \quad a &= -3 & \text{Solve each equation.}
\end{align*}
\]

The solution set is \( \{-3, 13\} \). Since \( (-3 - 5)^2 = 64 \) and \( (13 - 5)^2 = 64 \), the solutions check.

Squaring Numbers: A Shortcut

A shortcut helps you to square a positive two-digit number ending in 5. The method is developed using the idea that a two-digit number may be expressed as $10t + u$. Suppose $u = 5$.

$$(10t + 5)^2 = (10t + 5)(10t + 5)$$

$$= 100t^2 + 50t + 50t + 25$$

$$= 100t^2 + 100t + 25$$

$$(10t + 5)^2 = 100(t + 1) + 25$$

In words, this formula says that the square of a two-digit number ending in 5 has $t(t + 1)$ in the hundreds place. Then 2 is the tens digit and 5 is the units digit.

**Example**

Using the formula for $(10t + 5)^2$, find $85^2$.

$$85^2 = 100 \cdot 8 \cdot (8 + 1) + 25$$

$$= 7200 + 25$$

$$= 7225$$

Shortcut: First think $8 \cdot 9 = 72$. Then write 25.

Thus, to square a number, such as 85, you can write the product of the tens digit and the next consecutive integer $t + 1$. Then write 25.

Find each of the following using the shortcut.

1. $15^2$
2. $25^2$
3. $35^2$
4. $45^2$
5. $55^2$
6. $65^2$
7. What is the tens digit in the square of 95?
8. What are the first two digits in the square of 75?
9. Any three-digit number can be written as $100a + 10b + c$. Square this expression to show that if the last digit of a three-digit number is 5 then the last two digits of the square of the number are 2 and 5.

Rubric for Scoring Extended Response

General Scoring Guidelines

- If a student gives only a correct numerical answer to a problem but does not show how he or she arrived at the answer, the student will be awarded only 1 credit. All extended-response questions require the student to show work.

- A fully correct answer for a multiple-part question requires correct responses for all parts of the question. For example, if a question has three parts, the correct response to one or two parts of the question that required work to be shown is not considered a fully correct response.

- Students who use trial and error to solve a problem must show their method. Merely showing that the answer checks or is correct is not considered a complete response for full credit.

Demonstrate your knowledge by giving a clear, concise solution to each problem. Be sure to include all relevant drawings and justify your answers. You may show your solution in more than one way or investigate beyond the requirements of the problem.

1. Theo wants to build a rectangular deck on the front of his family’s café, and he wants the deck to have an area of \( A \) square feet. If the length of the deck is \( b \) feet longer than the width, then the equation \( A = x(x + b) \) gives the area of the deck in terms of the width \( x \).
   a. Explain the differences and similarities between \( A = x(x + b) \) and \( x^2 + bx - A \).
   b. What must be true about \(-A\) and \(b\) so that \( x^2 + bx - A \) is factorable?
   c. Choose values for \( A \) and \( b \) so that \( x^2 + bx - A \) is factorable. Then, substitute your values into \( x^2 + bx - A \) and factor the resulting polynomial.
   d. Substitute the values you chose for \( A \) and \( b \) in part c into \( A = x(x + b) \), and determine the area of the deck corresponding to these values and the dimensions of the deck.

2. A ball thrown horizontally has an initial upward velocity of 0 feet per second. The height \( h \), in feet, of the ball above the ground is modeled by the equation \( h = c - 16t^2 \) where \( c \) is the height at which the ball is thrown and \( t \) is the time in seconds after the ball is thrown.
   a. Compare possible values of \( c \) and \( h \), and determine whether \( h \) will ever be greater than \( c \). Explain your reasoning.
   b. Choose a value for \( c \) that is a perfect square, and determine how long it takes for the ball to hit the ground using your value for \( c \).
   c. Can a ball thrown horizontally at a height of 9 feet stay above the ground for more than 1 second? Explain your reasoning.

3. One way to factor a trinomial such as \( x^2 - 2x - 3 \) is to assign a value such as 10 to \( x \) and evaluate the expression.
   \[
   x^2 - 2x - 3 = 10^2 - 2(10) - 3 \\
   = 100 - 20 - 3 \\
   = 77
   \]
   A factorization of 77 is \( 7 \times 11 \). Since \( x = 10 \), \( 7 = x - 3 \) and \( 11 = x + 1 \). Multiply to see if \( (x - 3)(x + 1) = x^2 - 2x - 3 \).

   b. Try the method above to factor \( 2x^2 - 13x - 24 \). \( (\text{Hint: The factors will be of the form } (2x + a)(x - b). \) Show your work and explain each step.
   c. Try the method above to factor \( x^2 - 2x - 8 \). Why is it difficult to find the correct factors for this trinomial using the method above?
   d. Evaluate the expression in part c for \( x = 5 \). Then use the method above to find the factors. Explain each step. Remember in finding your factors that \( x = 5 \).

8-1 Graphing Calculator Activity

Second Degree Polynomial Functions

Many real world problems can be modeled using polynomial functions. The TABLE function can be used to evaluate a function for multiple values.

Example: An object is dropped from the top of a 179-foot cliff to the water below. The height of the object above the water can be modeled by \( h(t) = -16t^2 + 179 \) where \( t \) is time in seconds.

a. Determine the height of the object after 0.5 second, 1 second, 1.5 seconds, and 2 seconds. Enter the function into \( Y_1 \). Use \( \text{2nd} \) \( \text{TblSet} \) to set up the calculator to display values of \( t \) in 0.5 second intervals. Display the table and record the results. Examine the table. When \( x = 0.5, y = 175 \). This means that \( h(0.5) = 175 \), or that after 0.5 second, the object is 175 feet above the water. Thus, \( h(1) = 161 \) feet, \( h(1.5) = 143 \) feet, and \( h(2) = 115 \) feet.

b. After how many seconds does the object hit the water? Round to the nearest hundredth. Scroll through the table. Notice that the \( y \)-values change from \( 5 \) and \( 3.5 \). Examine this interval more closely by resetting the table using \( \text{TblStart} = 3 \) and \( \Delta \text{Tbl} = 0.1 \). Look for the change in sign. Further examine the interval from \( x = 3.3 \) to \( x = 3.4 \) using \( \text{TblStart} = 3.3 \) and \( \Delta \text{Tbl} = 0.01 \). The \( y \)-value closest to zero occurs when \( x = 3.34 \). Thus, the object hits the water after about 3.34 seconds.

Exercises

1. An object is dropped from the top of a building that is 412 feet high. The distance, in feet, above the ground at \( x \) seconds is given by \( P(x) = -16x^2 + 412 \). a. After how many seconds will the object be 100 feet above the ground? b. How many seconds will it take the object to reach the ground?

2. A bungee jumper free falls from the Royal Gorge suspension bridge over the Arkansas River, 1053 feet above the river. The height \( h \) of the bungee jumper above the river, in feet, after \( t \) seconds can be represented by \( h = -16t^2 + 1053 \). Two seconds after the first bungee jumper falls, another person jumps down with an initial velocity of 80 feet per second. The position of the second jumper can be represented by the equation \( h = -16t^2 - 20 - 80t - 2t + 1053 \). a. If the bungee cords are designed to stretch just enough so that the jumpers touch the water before springing back up, which jumper will touch the water first? How long does it take each jumper to touch the water? b. Does the second jumper catch up to the first jumper? If so, how far are they above the river at this point and how long does it take each jumper to reach this point?

Multiplying a Polynomial by a Monomial

Polynomial Multiplied by Monomial: The Distributive Property can be used to multiply a polynomial by a monomial. You can multiply horizontally or vertically. Sometimes multiplying results in like terms. The products can be simplified by combining like terms.

Example 1 Find \(-3x^2(4x^2 + 6x - 8)\).

Horizontal Method

\[-3x^2(4x^2) + (-3x^2)(6x) + (-3x^2)(-8)\]

\[-12x^4 + (-18x^3) - (-24x^2)\]

Vertical Method

\[4x^2 + 6x - 8\]

\[x\]

\[-3x^2\]

\[-12x^4 - 18x^3 + 24x^2\]

The product is \(-12x^4 - 18x^3 + 24x^2\).

Example 2 Simplify \(-2(4x^2 + 5x) - x(x^2 + 6x)\).

\[-2(4x^2 + 5x) - x(x^2 + 6x)\]

\[-8x^2 - 10x - x^3 - 6x^2\]

\[-x^3 - 14x^2 - 10x\]

Multiplying Polynomials

Multiply Binomials To multiply two binomials, you can apply the Distributive Property twice. A useful way to keep track of terms in the product is to use the FOIL method as illustrated in Example 2.

Example 1 Find \((x + 3)(x - 4)\).

Horizontal Method
\[
(x + 3)(x - 4) = x(x - 4) + 3(x - 4)
\]
\[
= x^2 - 4x + 3x - 12
\]
\[
= x^2 - x - 12
\]
Vertical Method
\[
\begin{array}{c}
\text{Top} \\
\underline{x + 3} \\
\text{Bottom} \\
\hline
x - 4 \\
\underline{-4x} \\
\underline{3x} \\
\underline{x^2 - x - 12}
\end{array}
\]

The product is \(x^2 - x - 12\).

Example 2 Find \((x - 2)(x + 5)\) using the FOIL method.

\[
(x - 2)(x + 5) = (x)(x) + (x)(5) + (-2)(x) + (-2)(5)
\]
\[
= x^2 + 5x - 2x - 10
\]
\[
= x^2 + 3x - 10
\]

The product is \(x^2 + 3x - 10\).

**Example** A box is made by cutting a square with sides $x$ inches long from each corner of a piece of cardboard and folding up the sides. If the piece of cardboard is 15 inches long and 12 inches wide, what integer value of $x$ allows you to make the box with the greatest volume? What is the volume?

**Step 1** The finished box will be $x$ inches high, $12 - 2x$ inches wide, and $15 - 2x$ inches long. The volume of the box is $(12 - 2x)(15 - 2x)$ cubic inches.

**Step 2** Use Column A of the spreadsheet for the value of $x$. Enter the formulas for the width, length, and volume in Columns B, C, and D.

<table>
<thead>
<tr>
<th>Height (cm)</th>
<th>Width (cm)</th>
<th>Length (cm)</th>
<th>Volume (cm³)</th>
</tr>
</thead>
<tbody>

</tr>
<tr>

</tr>
<tr>

</tr>
</tbody>
</table>

Notice that $x$ cannot be greater than 5 because $12 - 2x$ must be positive. In this case, the box with the greatest volume is 176 cubic inches when $x = 2$.

### Exercises

Use the spreadsheet to find the value of $x$ that allows the box with the greatest volume for each piece of cardboard. State the volume of the box.

1. 16 inches long and 10 inches wide
   - Volume: 144 in³
2. 24 inches long and 18 inches wide
   - Volume: 368 in³
3. 28 inches long and 16 inches wide
   - Volume: 360 in³
4. 36 inches long and 24 inches wide
   - Volume: 1820 in³
5. 48 inches long and 48 inches wide
   - Volume: 8192 in³
6. 108 inches long and 44 inches wide
   - Volume: 21,120 in³
7. Study the spreadsheet you created for Exercise 5. Suppose $y$ is the volume of the box with a height of $x$ inches. If you were to graph the ordered pairs $(x, y)$ and connect them with a smooth curve, what would you expect the graph to look like? Use the graphing tool in the spreadsheet to verify your conjecture. Sample answer: The graph would rise from (0, 0) to the point where $x$ gives the greatest volume and then fall back down toward the $x$-axis.

#### Squares of Sums and Differences

Some pairs of binomials have products that follow specific patterns. One such pattern is called the square of a sum. Another is called the square of a difference.

**Square of a Sum**

$(a + b)^2 = (a + b)(a + b) = a^2 + 2ab + b^2$

**Square of a Difference**

$(a - b)^2 = (a - b)(a - b) = a^2 - 2ab + b^2$

**Example 1** Find $(3a + 4)^2$.

Use the square of a sum pattern, with $a = 3a$ and $b = 4$.

$(3a)^2 + 2(3a)(4) + (4)^2 = 9a^2 + 24a + 16$

The product is $9a^2 + 24a + 16$.

**Example 2** Find $(2x - 9)(2x - 9)$.

Use the square of a difference pattern with $a = 2x$ and $b = 9$.

$(2x)^2 - 2(2x)(9) + (9)^2 = 4x^2 - 36x + 81$

The product is $4x^2 - 36x + 81$.

Product of a Sum and a Difference  There is also a pattern for the product of a sum and a difference of the same two terms, \((a + b)(a - b)\). The product is called the difference of squares.

Using the Distributive Property

Use the Distributive Property to Factor
The Distributive Property has been used to multiply a polynomial by a monomial. It can also be used to express a polynomial in factored form. Compare the two columns in the table below.

<table>
<thead>
<tr>
<th>Multiplying</th>
<th>Factoring</th>
</tr>
</thead>
<tbody>
<tr>
<td>(3(x + b) = 3x + 3b)</td>
<td>(3x + 3b = 3(x + b))</td>

<td>(4y - 4z = 4(y - z))</td>
</tr>
<tr>
<td>(9(y + 2x + 1) = 9y + 18x + 9)</td>
<td>(9y + 18x + 9 = 9(y + 2x + 1))</td>
</tr>
</tbody>
</table>

Example 1 Use the Distributive Property to factor \(12mp + 80m^2\).
Find the GCF of \(12mp\) and \(80m^2\).
\(12mp = 2 \cdot 2 \cdot 2 \cdot 3 \cdot m \cdot p\)
\(80m^2 = 2 \cdot 2 \cdot 2 \cdot 2 \cdot 5 \cdot m \cdot m\)
GCF = \(2 \cdot 2 \cdot m = 4m\)
Write each term as the product of the GCF and its remaining factors.
\(12mp + 80m^2 = 4m(3p) + 4m(20m)\)
\(= 4m(3p + 20m)\)
Thus \(12mp + 80m^2 = 4m(3p + 20m)\).

Example 2 Factor
\(6x + 3y + 2bx + by\) by grouping.
\((3a + b)(2x + y)\)
\(= 3a(2x + y) + b(2x + y)\)
\(= 6x + 3y + 2bx + by\)

Using the Distributive Property

Solve Equations by Factoring The following property, along with factoring, can be used to solve certain equations.

Zero Product Property For any real numbers a and b, if ab = 0, then either a = 0, b = 0, or both a and b equal 0.

Example Solve 9x^2 + x = 0. Then check the solutions.

Write the equation so that it is of the form ab = 0.

9x^2 + x = 0 Original equation
x(9x + 1) = 0 Factor the GCF of 9x^2 + x, which is x.
x = 0 or 9x + 1 = 0 Zero Product Property
x = 0 or x = −1/9 Solve each equation.

The solution set is {0, −1/9}.

Check Substitute 0 and −1/9 for x in the original equation.

9(0)^2 + (0) = 9(0) + 1 = 0 9(−1/9)^2 + (−1/9) = 0
0 = 0 ✓ 0 = 0 ✓

Linear Combinations
The greatest common factor, GCF, of two numbers can be written as a linear combination of the two numbers. A linear combination is an expression of the form \(ax + by\).

Example 1
Write the greatest common factor of 52 and 36 as a linear combination.

First, use the Euclidean Algorithm to find the greatest common factor of the two numbers.

\[
\begin{align*}
52 & \div 36 = 1 \text{ remainder } 16 \\
36 & \div 16 = 2 \text{ remainder } 4 \\
16 & \div 4 = 4 \text{ remainder } 0
\end{align*}
\]

Last divisor used is the GCF. In this case, 4 is the GCF for 36 and 52.

To write 4 as a linear combination of 36 and 52, it needs to be written as:

\[4 = 36x + 52y\]

where \(x\) and \(y\) are some integers.

Use trial and error to determine the two integers.

The two integers that work are \(x = 3\) and \(y = -2\). So, the linear combination for the greatest common factor of 52 and 36 is:

\[4 = 36(3) + 52(-2)\]

Exercises
Write the greatest common factor for each pair of numbers as a linear combination.

1. \(16, 64\)  
   \[16 = 16(1) + 64(0)\]

2. \(2, 28\)

3. \(3, 18\)

4. \(4, 36\)  
   \[4 = 15(5) - 36(2)\]

5. \(5, 6\)  
   \[2 = 6(-1) + 8(1)\]

6. \(6, 12\)  
   \[6 = 18(-2) + 42(1)\]

1. Use a calculator to help you find the 25 prime numbers less than 100.

Prime numbers have interested mathematicians for centuries. They have tried to find expressions that will give all the prime numbers, or only prime numbers. In the 1300s, Euler discovered that the trinomial \(x^2 + x + 41\) will yield prime numbers for values of \(x\) from 0 through 39.

2. Find the prime numbers generated by Euler’s formula for \(x\) from 0 through 7.

3. Show that the trinomial \(x^2 + x + 31\) will not give prime numbers for very many values of \(x\).
   It works for \(x = 0, 2, 3, 5, 6\) but not for \(x = 1, 4, 7\)

4. Find the greatest prime number generated by Euler’s formula.

Goldbach’s Conjecture is that every nonzero even number greater than 2 can be written as the sum of two primes. No one has ever proved that this is always true, but no one has found a counterexample, either.

5. Show that Goldbach’s Conjecture is true for the first 5 even numbers greater than 2.

6. Give a way that someone could disprove Goldbach’s Conjecture.

Solving \( ax^2 + bx + c = 0 \)

**Solve Equations by Factoring**

Factoring and the Zero Product Property can be used to solve some equations of the form \( ax^2 + bx + c = 0 \).

**Example**

Solve \( 12x^2 + 3x = 2 - 2x \). Check your solutions.

Original equation

\[ 12x^2 + 5x - 2 = 0 \]

Rewrite equation so that one side equals 0.

\[ (3x + 2)(4x - 1) = 0 \]

Factor the left side.

\[ 3x + 2 = 0 \text{ or } 4x - 1 = 0 \]

Zero Product Property

\[ x = -\frac{2}{3}, \quad x = \frac{1}{4} \]

Solve each equation.

The solution is \( \left\{ -\frac{2}{3}, \frac{1}{4} \right\} \).

Since \( 12\left(-\frac{2}{3}\right)^2 + 3\left(-\frac{2}{3}\right) = 2 - 2\left(-\frac{2}{3}\right) \) and \( 12\left(\frac{1}{4}\right)^2 + 3\left(\frac{1}{4}\right) = 2 - 2\left(\frac{1}{4}\right) \), the solutions check.

Area Models for Quadratic Trinomials

After you have factored a quadratic trinomial, you can use the factors to draw geometric models of the trinomial.

The TABLE feature can be used to help factor a polynomial by finding the factors of a certain product, which have a specific sum.

Factor each trinomial. Then follow the directions to draw each model of the trinomial.

1. \( x^2 + 2x - 3 \) Use \( x = 2 \). Draw a rectangle in centimeters. 
\[ (x + 3)(x - 1) \]

2. \( 3x^2 + 5x - 2 \) Use \( x = 1 \). Draw a rectangle in centimeters. 
\[ (x + 2)(3x - 1) \]

3. \( x^2 - 4x + 3 \) Use \( x = 4 \). Draw two different right triangles in centimeters. 
\[ (x - 1)(x - 3) \]

4. \( 9x^2 - 9x + 2 \) Use \( x = 2 \). Draw two different right triangles. Use 0.5 centimeter for each unit. 
\[ (3x - 2)(3x - 1) \]

Thus, 10 \( x^2 - 43x + 28 \) by grouping.

\[ 10x^2 - 43x + 28 = 10(x^2 - 4x + 28) \]
\[ = 2(x^2 - 4x + 28) \]
\[ = 2(x^2 - 4x + 4) \]
\[ = 2(x - 2)^2 \]

The area of the right triangle is also \( x^2 + 5x - 6 \).

To draw a rectangular model, the value of factors whose sum is \( -x \) so that the shorter side would have a length of 1. Then the drawing was done in centimeters. So, the area of the rectangle is \( x^2 + 5x - 6 \).

To draw a right triangle model, recall that the area of a triangle is one-half the base times the height. So, one of the sides must be twice as long as the shorter side of the rectangular model.

To display the negative factors of 280 by setting \( Tbl = 1 \).

Example 2

Factor 12 \( x^2 - 7x - 12 \).

Look at the factors of 12 - 12 or -144 for a pair whose sum is -7. Enter an equation to determine the factors in \( Y1 \) and an equation to find the sum of factors in \( Y2 \). Examine the table to find a sum of -7.

\[ 12x^2 - 7x - 12 = 12x^2 + 9x + (-16x) - 12 \]
\[ = 3(4x + 3) - 4(4x + 3) \]
\[ = (4x + 3)(3x - 4) \]

Thus, 12 \( x^2 - 7x - 12 \) = (4x - 3)(3x - 4).

Exercises

3. \( 2x^2 + 16x + 35 \)

4. \( 6x^2 - 25y + 18 \) 
\[ (3x - 2)(2y + 3) \]

5. \( 6x^2 - 20y + 21 \) 
\[ (3x - 2)(2y + 3)(2m + 3)(3n + 2) \]

6. \( 12x^2 - 7x - 12 \) 
\[ (4x - 3)(3x - 2) \]

7. \( 9x^2 + 40y + 25 \) 
\[ (4y + 5)^2 \]

8. \( 9x^2 + 40y + 25 \) 
\[ (4y + 5)^2 \]

9. \( 4x^2 - 26x - 126 \)

26. FORENSICS Mr. Cooper contested a speeding ticket given to him after he applied his brakes and skidded to a halt to avoid hitting another car. In traffic court, he argued that the length of the skid marks on the pavement, 150 feet, proved that he was driving under the posted speed limit of 65 miles per hour. The ticket cited his speed at 70 miles per hour. Use the formula \(d = \frac{1}{2}at^2\), where \(a\) is the speed of the car and \(d\) is the length of the skid marks, to determine Mr. Cooper’s speed when he applied the brakes. Was Mr. Cooper correct in claiming that he was not speeding when he applied the brakes? \(60\ mph: \text{yes}\)
**8-8 Word Problem Practice**

**Differences of Squares**

1. **LOTTERY** A state lottery commission analyzes the ticket purchasing patterns of its citizens. The following expression is developed to help officials calculate the likely number of people who will buy tickets for a certain size jackpot. 

\[ 81a^2 - 36b^2 \]

Factor the expression completely. 

\[ 9(3a + 2b)(3a - 2b) \]

2. **OPTICS** A reflector on the inside of a certain flashlight is a parabola given by the equation \( y = x^2 - 25 \). The length and width, but he remembers that the length was 8 more than some number and the width was 8 less than that same number.

\[ x + 8 \]

3. **ARCHITECTURE** The drawing shows a triangular roof truss with a base measuring the same as its height. The area of the truss is 96 square meters.

Find the height of the truss. 14 m

Find the length and width of the rug? 20 ft and 4 ft

4. **BALLOONING** The function \( f(t) = -16t^2 + 576 \) represents the height of a freely falling ballast bag that starts from rest on a balloon 576 feet above the ground. After how many seconds \( t \) does the ballast bag hit the ground? After 6 seconds

5. **DECORATING** Marvin wants to purchase a rectangular rug. It has an area of 80 square feet. He cannot remember the length and width, but he remembers the length was 8 more than some number and the width was 8 less than that same number.

\[ a = 13 \text{ and } b = 5 \]

**8-8 Enrichment**

**Factoring Trinomials of Fourth Degree**

Some trinomials of the form \( a^4 + a^2b^2 + b^4 \) can be written as the difference of two squares and then factored.

**Example** Factor \( 4x^4 - 37x^2y^2 + 9y^4 \).

**Step 1** Find the square roots of the first and last terms.

\[ \sqrt{4x^4} = 2x^2 \]

\[ \sqrt{9y^4} = 3y^2 \]

**Step 2** Find twice the product of the square roots.

\[ 2(2x^2)(3y^2) = 12x^2y^2 \]

**Step 3** Separate the middle term into two parts. One part is either your answer to Step 2 or its opposite. The other part should be the opposite of a perfect square.

\[ -37x^2y^2 = -12x^2y^2 - 25x^2y^2 \]

**Step 4** Rewrite the trinomial as the difference of two squares and then factor.

\[ 4x^4 - 37x^2y^2 + 9y^4 = (4x^4 - 12x^2y^2 + 9y^4) - 25x^2y^2 \]

\[ = (2x^2 - 3y^2)^2 - 25x^2y^2 \]

\[ = [(2x^2 - 3y^2) + 5xy][(2x^2 - 3y^2) - 5xy] \]

\[ = (2x^2 + 5xy - 3y^2)(2x^2 - 5xy - 3y^2) \]

**Factor each polynomial.**

1. \( x^4 + x^2y^2 + y^4 \)

\[ (x^2 + xy + y^2)(x^2 - xy + y^2) \]

2. \( x^4 + x^2 + 1 \)

\[ (x^2 + x + 1)(x^2 - x + 1) \]

3. \( 9a^4 - 16b^4 + 1 \)

\[ (3a^2 + 3a - 1)(3a^2 - 3a - 1) \]

4. \( 16a^4 - 17a^2 + 1 \)

\[ (4a - 1)(a + 1)(a + 1)(a - 1) \]

5. \( 4a^4 - 16a^2 + 1 \)

\[ (2a^2 - 3a + 1)(2a^2 - 3a - 1) \]

6. \( 9a^4 + 26a^2b^2 + 25b^4 \)

\[ (3a^2 + 2ab + 5b^2)(3a^2 - 2ab + 5b^2) \]

7. \( 4a^4 - 21a^2y^2 + 9y^4 \)

\[ (2x^2 + 3xy - 3y^2)(2x^2 - 3xy + 3y^2) \]

8. \( 4a^4 - 29a^2b^2 + 25b^4 \)

\[ (2a + 5b)(a - b)(2a - 5b)(a + b) \]
There is a special pattern you can use to factor binomials of the form \(a^2 - b^2\). You can use a spreadsheet to discover this relationship.

**Example**

Use a spreadsheet to investigate the values of the expressions \((a^2 - b^2), (a - b)(a + b), \) and \((a + b)^2\). What conjecture can you make about the expressions?

**Step 1**
You will use Columns A and B to enter various values that you choose for \(a\) and \(b\).

**Step 2**
Enter the formulas for \((a^2 - b^2), (a - b)(a + b), \) and \((a + b)^2\) in Columns C, D, and E, respectively. To enter an exponent, use the symbol \(^n\) followed by the exponent. For example, the square of the value in cell A2 is entered as \(A2^2\).

2. Find the products of \((a - b)^2, (a - b)(a + b), \) and \((a + b)^2\). Do the results verify your conjecture? \((a - b)^2 = a^2 - 2ab + b^2; (a - b)(a + b) = a^2 - b^2; \) and \((a + b)^2 = a^2 + 2ab + b^2\); yes

**8-9 Study Guide and Intervention**

**Perfect Squares**

Factor Perfect Square Trinomials

The patterns shown below can be used to factor perfect square trinomials.

**Example 1**

Determine whether \(16n^2 - 24n + 9\) is a perfect square trinomial. If so, factor it.

Since \(16n^2 = (4n)^2\), the first term is a perfect square.
Since \(9 = 3^2\), the last term is a perfect square.
The middle term is equal to \(2(4n)(3)\).
Therefore, \(16n^2 - 24n + 9\) is a perfect square trinomial.
\(16n^2 - 24n + 9 = (4n)^2 - 2(4n)(3) + 3^2 = (4n - 3)^2\)

**Example 2**

Factor \(16x^2 - 32x + 15\).
Since 15 is not a perfect square, use a different factoring pattern.
\(16x^2 - 32x + 15 = 16x^2 + 4x + mx + px + 15\)
Write the pattern.
\(16x^2 = 16x^2 - 20x + 15\)
m = 12 and \(p = -20\)
\(16x^2 - 20x + (12x - 15)\) Group terms.
\(4x(4x - 5)(4x - 3)\) Find the GCF.
\((4x - 5)(4x - 3)\) Factor by grouping.
Therefore \(16x^2 - 32x + 15 = (4x - 5)(4x - 3)\).

**Exercises**

Determine whether each trinomial is a perfect square trinomial. Write yes or no.
If so, factor it.

Factor each polynomial, if possible. If the polynomial cannot be factored, write prime.

4. \(9x^2 + 200y^2\) 5. \(x^2 + 22x + 121\) prime
\(2(7x + 10y)(7x - 10y)\) \((x + 11)^2\) \((9 + y)^2\)
7. \(25x^2 - 10x - 1\) prime \(8. 169 - 28r + r^2\) \(9. 7r^2 - 9x + 2\)

**Solve Equations with Perfect Squares**

Factoring and the Zero Product Property can be used to solve equations that involve repeated factors. The repeated factor gives just one solution to the equation. You may also be able to use the Square Root Property below to solve certain equations.

3. Set repeated factor equal to 0: $x - 3 = 0$
4. Solve: $x = 3$

The solution set is $\{3\}$. Since $3^2 - 6 \cdot 3 + 9 = 0$, the solution checks.

The solution set is $\{-3, 13\}$. Since $(-3 - 5)^2 = 64$ and $(13 - 5)^2 = 64$, the solutions check.

**Squaring Numbers: A Shortcut**

A shortcut helps you to square a positive two-digit number ending in 5. The method is developed using the idea that a two-digit number may be expressed as $10t + u$. Suppose $u = 5$.

\[
(10t + 5)^2 = (10t + 5)(10t + 5) = 100t^2 + 100t + 25
\]

In words, this formula says that the square of a two-digit number ending in 5 has $t(t + 1)$ in the hundreds place. Then 2 is the tens digit and 5 is the units digit.

**Example**

Using the formula for $(10t + 5)^2$, find $85^2$.

\[
85^2 = 100 \cdot 8 \cdot (8 + 1) + 25 = 7200 + 25 = 7225
\]

Shortcut: First think $8 \cdot 9 = 72$. Then write 25.

Thus, to square a number, such as 85, you can write the product of the tens digit and the next consecutive integer $t + 1$. Then write 25.

Find each of the following using the shortcut.

1. $15^2$ 225
2. $25^2$ 625
3. $35^2$ 1225
4. $45^2$ 2025
5. $55^2$ 3025
6. $65^2$ 4225

7. What is the tens digit in the square of 95? 2

8. What are the first two digits in the square of 75? 56

9. Any three-digit number can be written as $100a + 10b + c$. Square this expression to show that if the last digit of a three-digit number is 5 then the last two digits of the square of the number are 2 and 5.

\[
10,000a^2 + 2000ab + 100ac + 100b^2 + 20bc + c^2 = 10,000a^2 + 2000ab + 1000a + 100b^2 + 10b + 25
\]

The last two digits are not affected by the first five terms.

Sample Answers

In addition to the scoring rubric found on page A37, the following sample answers may be used as guidance in evaluating extended-response assessment items.

1a. The student should recognize that $A = x(x + b)$ is an equation and $x^2 + bx - A$ is a trinomial expression. When the equation is put into standard form, the trinomial expression is one side of the equation. For example, $A = x(x + b)$ is equivalent to $x^2 + bx - A = 0$.

1b. For $x^2 + bx - A$ to factor, there must be factors of $-A$ whose sum is $b$.

1c. Sample answer: $A = 144$, $b = 10$; $x^2 + 10x - 144 = (x + 18)(x - 8)$

1d. Sample answer: $144 = x(x + 10)$; 144 sq ft; width is 8 ft, length is 18 ft

2a. The student should recognize that both $c$ and $h$ must be positive to be above ground, and since $c$ is the starting height and $h$ is equal to $c$ minus $16t^2$ where $t^2$ is always positive, $h$ will always be less than or equal to $c$.

2b. Sample answer: $c = 4$; $\frac{1}{2}$ s

2c. The student should explain that $c = 9$ and $h = 0$ yields a solution set of $\{-\frac{3}{4}, \frac{3}{4}\}$. Since we are considering only the time after the ball is thrown, the ball is only in the air for $\frac{3}{4}$ second. Thus, a ball thrown horizontally at a height of 9 feet cannot stay above the ground for more than 1 second.

3a. Sample answer: Choose a value for $x$ and evaluate $x^2 - 8x + 15$.

\[ x^2 - 8x + 15 = 10^2 - 8(10) + 15 = 35 \]

A factorization of 35 is $5 \times 7$. Since $x = 10$, $5 = x - 5$ and $7 = x - 3$.

Check the product $(x - 5)(x - 3)$.

\[ (x - 5)(x - 3) = x^2 - 8x + 15 \checkmark \]

3b. Sample answer: Choose a value for $x$ and evaluate $2x^2 - 13x - 24$.

\[ 2x^2 - 13x - 24 = 2(10)^2 - 13(10) - 24 = 46 \]

A factorization of 46 is $2 \times 23$. Since $x = 10$, $2 = x - 8$ and $23 = 2x + 3$.

Check the product $(x - 8)(2x + 3)$.

\[ (x - 8)(2x + 3) = 2x^2 + 3x - 16x - 24 = 2x^2 - 13x - 24 \checkmark \]

3c. Sample answer: Choose a value for $x$ and evaluate $x^2 - 2x - 8$.

\[ x^2 - 2x - 8 = 10^2 - 2(10) - 8 = 72 \]

A factorization of 72 is $6 \times 12$. Since $x = 10$, $6 = x - 4$ and $12 = x + 2$.

Check the product $(x - 4)(x + 2)$.

\[ (x - 4)(x + 2) = x^2 + 2x - 4x - 8 = x^2 - 2x - 8 \checkmark \]

The student should explain that there are more factors for 72 than for the numbers in the previous parts, thus making the process more difficult in finding the correct factors.

3d. Sample answer: Evaluate

\[ x^2 - 2x - 8 \text{ for } x = 5. \]

\[ x^2 - 2x - 8 = 5^2 - 2(5) - 8 = 7 \]

The only factorization of 7 is $1 \times 7$. Since $x = 5$, $1 = x - 4$ and $7 = (x + 2)$.

Check the product $(x - 4)(x + 2)$.

\[ (x - 4)(x + 2) = x^2 + 2x - 4x - 8 = x^2 - 2x - 8 \checkmark \]
